Here, we examine and provide some common solutions to these problems below: Use an app for package installation: Some files APK come in packages, and you need an installer like Split APKs Installer to have them installed on your device. By looking at the file extension name, you can distinguish split APKs from regular APKs. Files with APKM, XAPK, and APKS are not regular APKs and will need a file extension like the Split APKs Installer. Run a clean installation, do not update: You can upgrade to a newer version that works optimally. But that doesn't always work. How about uninstalling the original application and running a clean installation instead of replacing, updating it? Room: The lack of space is not the most common reason for an application not to open, but it is common. Make sure there is storge space before, doing as follows: Using an SD card for media like music, videos and photos. Make use of unlimited Google Photo storage. Use Google Drive or other third-party cloud service Clear application data Uninstall used apps Make sure that the file is not corrupted: Some third-party applications often come corrupted and unsafe. And when they are in this state, they do not run and are unstable. So you should always download from known and trusted third-party websites such as Mirror APK and similar websites that check apps before making them available. Enable installation of unknown sources: You will need to allow third-party installations to open unofficial APK files. Frequently Asked Questions Why would I want an APK file?
